

A CRM remembers what you typed. Faragopedia understands what you know.

A CRM is a **system of record** — structured slots you fill in and later struggle to read back. Faragopedia is a **system of understanding**: it reads your material, writes it up as interlinked pages, and keeps the whole thing current on its own. The question was never “which is the better CRM?” It's that **no CRM does this at all** — and this is the capability the business actually lacked.

— THE CORE DIFFERENCE

Two ways to hold what you know

Point a CRM and Faragopedia at the same person and you get two fundamentally different objects. A CRM gives you a record — fields in a box, walled off from every other record. Faragopedia gives you a node in a living graph, wired to the company, the project, the people and the very sources each fact came from.

A CRM RECORD

CONTACT · JANE OKAFOR	
NAME	Jane Okafor
COMPANY	— not filled in
EMAIL	— not filled in
STAGE	Lead
NOTES	free text, rarely re-read

Structured slots, siloed from every other record — and empty until a human fills them in.

THE SAME PERSON IN FARAGOPEDIA

VS.

One node in a graph you can actually see — every link written and maintained by the AI, traceable back to its source.

THE CRUX The difference isn't cosmetic. A record stores fields; a graph stores meaning. Every advantage below follows from that one distinction.

Three things a subscription CRM structurally will not do

01

It reads and writes itself

Drop in a document, an email, a web article or a PDF and the AI pulls out what matters, updates the right pages, and wires up the cross-references. A CRM's fields stay empty until a human types — and its free-text notes are where knowledge goes to die.

Ingestion: **source in → linked pages out**

02

Knowledge is linked, not filed

Every person, company and project is a node in a graph you can browse and see whole (the Link View). Relationships surface at a glance instead of hiding across unrelated records. A CRM can filter a list; it can't show you the shape of what you know.

View: **the whole network**, not one record

03

It keeps itself honest

A built-in health check finds orphaned pages, broken links, stale claims and contradictions — and proposes the fixes. CRM data quietly rots because nobody audits it; Faragopedia audits and maintains itself.

Upkeep: **AI-audited**, not left to rot

Same person, two very different objects

	OFF-THE-SHELF CRM	FARAGOPEDIA
WHAT IT HOLDS	Structured records in fixed fields	Interlinked pages of synthesised knowledge
GETTING DATA IN	Manual entry into forms	AI reads documents, web & PDFs, writes pages
FREE-TEXT NOTES	Buried per-record, rarely re-read	Synthesised into linked, maintained pages
SEEING RELATIONSHIPS	Filtered lists & kanban boards	A visual knowledge graph (Link View)
STAYING ACCURATE	Degrades; no one audits it	AI health-check flags stale & conflicting claims
OWNERSHIP	Rented SaaS; export is painful	Plain markdown we self-host and own

The honest accounting

What a CRM leaves you paying for anyway

- + Per-seat CRM **fees** — **\$12–\$175+** per user / month — plus onboarding of **\$1,500–\$3,500**
- + A separate **wiki / knowledge base** (Notion, Confluence) — a CRM can't hold synthesised knowledge
- + An **AI or search add-on** to make any of it retrievable
- + The **human hours** to keep notes written, linked and current

Typical 2026 market pricing. And it's rented: even fully paid-up, a CRM still can't read a document, link it, or keep it current — and the knowledge leaves when the subscription lapses.

Where a CRM genuinely wins

- ✓ Deal **pipeline**, quotes & forecasting — Faragopedia has no sales funnel
- ✓ Native **email & calendar** logging
- ✓ **Multi-user** accounts & permissions — Faragopedia's MVP is single-tenant today (on the hardening roadmap)
- ✓ Structured **dashboards**, mobile apps, vendor support

Faragopedia isn't a CRM replacement — it's the **institutional-memory layer** a CRM has never provided. Run a CRM for the pipeline if we need one; let Faragopedia hold the understanding.

— BOTTOM LINE

A CRM would give us **tidy records we'd still have to read, maintain and connect ourselves**. Faragopedia reads our material, links it, keeps it current, and shows us the whole picture — self-hosted and ours. A CRM remembers what we typed. This **understands what we know**.
