

Why not just buy a CRM?

A CRM is a **system of record** — a filing cabinet someone has to fill in by hand. What we built is a **system of intelligence**: it finds the leads, verifies the contacts, writes the record, and turns every meeting into knowledge that compounds. The real choice isn't “CRM vs. this.” It's a **database someone must feed** vs. **a loop that feeds itself**.

THE ENGINE - ONE CLOSED LOOP ACROSS TWO PURPOSE-BUILT SYSTEMS

THREE THINGS A SUBSCRIPTION CRM WON'T DO

- 01

It finds who to approach, not just their email
CRMs can enrich a contact from a name & company — but only as a paid add-on, once you've decided who that is. Ours does the deciding: fit-calibrated targets each week, verified and written in.
Per contact: ~30 min of hunting → 3-5 sec
- 02

Knowledge compounds instead of sitting in fields
A CRM stores flat records. Faragopedia builds a self-maintaining knowledge graph — every meeting enriches an interlinked web of people, companies & context.
Output = **institutional memory**, not a list
- 03

It lives where the work already happens
No new tool, no migration, no seats to train. Prospects surface in the Google Sheet in use; intelligence surfaces in a wiki anyone can read.
Adoption cost: **zero new software**

What the off-the-shelf route actually costs

+ CRM seats — \$12-\$175+ per user / month

+ A **data-enrichment** add-on to auto-fill contacts — ~\$49-\$99/mo or ~\$0.20+/contact overage

+ **Integration middleware** (Zapier / Make) to wire it together

+ **Onboarding \$1,500-\$3,500**; certified consultants \$100-\$300/hr

+ ... and you'd **still prospect by hand**

Typical 2026 market pricing. The sticker price is only the first line — and none of it decides who to approach for you.

SAME JOB, TWO VERY DIFFERENT MACHINES

	OFF-THE-SHELF CRM	FARAGO BD SYSTEM
FINDING LEADS	You research & type them in	AI proposes calibrated targets weekly
CONTACT DATA	Paid add-on, then map fields	RocketReach-verified, written in for you
STAYING CURRENT	Manual entry & hygiene	AI maintains pages, links & conflicts
KNOWLEDGE MODEL	Flat records, fixed fields	Interlinked graph that compounds
WHERE YOU WORK	A separate app to adopt	The sheet & wiki already in use
OWNERSHIP	Rented; intel leaves on cancel	Portable files we own outright

Where a CRM genuinely wins

✓ Mature **deal-pipeline** mechanics & forecasting

✓ Native **email & calendar** logging

✓ **Multi-user** permissions & large-team workflows

✓ Out-of-the-box **dashboards**, mobile apps, vendor support

We deliberately don't compete on funnel mechanics for a big team. This is built for a focused BD workflow — and if we ever need pipeline mechanics, **this loop can feed a CRM rather than be replaced by one.**

THE COST A CRM HIDES - TIME

Research & enrich, per contact: ~20-30 min by hand → 3-5 sec automated. Retrieval that takes minutes of digging in a CRM is one search here.

10-30×

more throughput — one run handles 5 contacts or 500 at the same time cost, so volume never means another hire

BOTTOM LINE

A CRM would give us a **differently-organised place to store contacts we'd still have to find ourselves**. This gives us the contacts, the context, and a knowledge base that compounds — inside the tools the team already uses. It isn't a cheaper CRM. It's a different, and for our purpose better, machine.
